

HUMAN SUBSEQUENT DRONE INVOLVED FOR RESCUING

PROJECT BY: LEANDRO V.P AND PRASANNA.M [CLASS XI]

ARISTO PUBLIC SCHOOL, CUDDALORE

GUIDED BY.MRS.U.DIANA SYLVIA & MRS.T. KALAIVANI

ABSTRACT

Disaster is an exceptional events in our day today life which can be natural or manmade .In this project we are utilising drone based sensor system to follow a human by detecting their image stream and if any disaster is nearing a person an alert is given and the person can be safe. In addition to that the drone helps in identifying the person during disaster times. The speciality of our project is the drone is fully automatic and smart. In our project we involve Arduino that recognizes different shapes with its camera module, and depending on what sees sends commands. In which we have planned to use this drone to detect criminal in huge mass of crowd and also in the lifesaving action in mountains and remote areas. Our drone is equipped with the following sensors and software. This is what we actually used to make the project come to reality.

- a. APM Flight controller --- Arduino based flight controller, holds the drone in balance, analyses GPS Signals, controls the motors (this technology existed)
- b. Arduino board – Main Control unit
- c. The Drone Mechanism --- hexacopter frame, motors, camera holder, 1000mAh batteries, GPS, propellers (weighs more than 2kg)
- d. Distance Sensors --- ultrasonic sensors that detects distance from objects

e. Bluetooth Communication Module

f. MPU 6050 gyroscope
